

IT Committee

Danish-French Chamber of Commerce

Purpose of the committee

New technologies including artificial intelligence, cloud and digitization of business processes require managers to develop comprehensive digitization strategies to keep up with the fast pace of the market.

Very often, the technological development happens faster than the legislative development and employee readiness, and this means that CIO's face challenges of not only introducing new technology but also implementing it (safely) throughout the organization.

Meanwhile, cyberattacks have become one of the most pressuring threats, making ongoing education and system development key to business continuity.

In 2024, the Danish-French Chamber of Commerce will launch an IT committee to discuss the opportunities and challenges around technology in modern day management. The committee will function as a forum where IT-managers and IT-specialists from different sectors can bring forward their knowledge and concerns to inspire each other and develop solutions in thematic areas.

Participants

- IT companies in the Chamber's network
- CIO's or IT-managers from the Chamber's member companies, representing all types of sectors (banking, engineering, FMCGs, food and beverage etc.)
- External experts, who will be invited to share their experiences, insights, and opinions on certain topics
