

HMM COVID TEST SYSTEM

The holes in the diagram indicate undetected infections due to possible limitations of the screening devices.

The subsequent defence layers considerably improve the conditions of safe working environment by reducing the health hazards.

Active or latent infections and the possible shortcomings of screening defects can be best detected by multilevel screenings illustrated by the diagram above. **The core** of screenings is the **PREVENTIVE rapid testing of ALL employees returning to the workplace.**

The avoidance of the occurrence of employees becoming ill is of utmost importance in the current pandemic situation so **it is advisable to use the entire spectrum of procedures available.** (E.g. necessary supplementary measures arising from risk assessments and free information sessions provided on site or online.)
